Code Review Assistant

About:

CodeReviewAssistant is a Blazor Interactive Server app (targeting .NET 8) that leverages a GROQ-compatible OpenAI endpoint to deliver concise automated code reviews. Users paste source code into a browser editor and configure AI settings (model, temperature, max tokens, counts) in Settings, entering the GROQ API key first. The app builds system and user prompts, sends them via **HttpClient** to the GROQ chat completions API, and parses responses into Improvements, Positive notes, and optional Refactored Code. Toasts provide UI feedback. The solution favors simplicity: in-memory settings, clear parsing logic, and a Dockerfile for containerized deployment. Extensible for persistent storage and testing.
